ACCESSFLOW AI

HYPER-PERSONALIZED BANKING WITH AI

Banking that adapts to every customer.

A bank-integration SDK that personalizes language, accessibility and interaction from registration to everyday banking - without replacing the bank app.

Zenith Bank Zecathon 6.0 • 2026

POWERED BY N-ATLAS

[LIVE PROTOTYPE](#)

THE PROBLEM

Personalization stops at marketing. The banking experience is still one-size-fits-all.

Barriers start before login and persist through the entire customer lifecycle.

Language

Digital journeys often default to English and break down when customers code-switch.

Ability

Visual-only, audio-only and precision-touch flows exclude customers from independent banking.

Complexity

KYC, authentication and financial jargon create avoidable abandonment and support dependence.

The gap is not access to data - it is the inability to turn customer preferences into a banking journey that adapts in real time.

Every stage can create a different accessibility and personalization failure.

Personalize how banking works - not only what offer appears next.

AccessFlow turns personalization into an adaptive experience layer.

ONE CUSTOMER-CONTROLLED PROFILE

Language

English · Yoruba · Hausa · Igbo · Pidgin | Powered by N-ATLAS

Interaction

Voice · text · screen reader · captions · switch/keyboard

Comprehension

Easy Banking · step-by-step guidance · extended time

Applied across the lifecycle

- 01 Register
- 02 Verify
- 03 Secure
- 04 Bank
- 05 Support

AccessFlow is an SDK/platform inside the bank - not a replacement bank app.

Zenith keeps identity, authentication, accounts and transaction authority. AccessFlow adapts the experience.

BANK CHANNELS

Mobile • Web • Contact Centre • Branch

ACCESSFLOW SDK + ORCHESTRATION

Adaptive UI • language intelligence • journey orchestration
• accessibility telemetry

ZENITH / BANK SYSTEMS

Customer identity • KYC • authentication • core banking •
payments • fraud

Design rule: AI interprets. The bank authorizes.

A multi-agent experience engine - with deterministic safety boundaries.

Each agent contributes one job; no agent has unilateral authority to move money.

01 **Preference Agent**

Loads customer-controlled language, accessibility and interaction preferences.

02 **N-ATLAS Language Agent**

Powered by N-ATLAS for Nigerian-language understanding and code-switching.

03 **Journey Agent**

Adapts the next step across onboarding, KYC, authentication, payments and support.

04 **Safety Agent**

Enforces confidence, beneficiary, amount, confirmation, limits and authentication.

05 **Insight Agent**

Shows where customers struggle or abandon journeys - without diagnosing disability.

**STATE-CHANGING ACTIONS
remain deterministic**

LLM output is never authoritative bank state.

Accessibility begins before the customer has an account.

The first interaction is personalized before we ask for personal information.

- 1

Choose experience

Language, voice, captions, screen reader, larger controls, Easy Banking.
- 2

Register

Accessible form with clear labels and progressive guidance.
- 3

Verify contact

Visual + spoken OTP; production can add alternative channels.
- 4

Accessible KYC

Guided camera, document + review, or assisted verification path.
- 5

Secure account

PIN plus bank-controlled passkey/biometric preference.
- 6

Consent + activate

Plain-language summary, explicit consent and final review.

Natural language in. Structured banking intent out.

Nigerian-language interaction becomes safe, auditable bank actions.

“Abeg send 15k give Chinedu.”

Nigerian Pidgin request

- N-ATLAS → multilingual language + intent
- AccessFlow → structured action
- Bank → resolve + validate
- Customer → confirm + authenticate
- Bank → execute + receipt

No beneficiary + no amount + no confirmation + no authentication = no transfer.

We are applying with a working prototype - not only a concept.

The demo proves pre-login onboarding, adaptive banking, transaction guardrails and bank analytics.

01

Accessible registration

Language + assistance before PII, synthetic registration, multimodal OTP, flexible KYC, security, consent and activation.

02

Adaptive banking

Five-language interaction, code-switching, accessibility profile, voice/text banking and accessible confirmations.

03

Bank intelligence

Journey events, language/mode usage, onboarding funnel, support/fraud events and accessibility friction analytics.

36 / 36

automated tests passing

LIVE DEMO

accessflow-ai-demo.onrender.com

</register> | </> | </admin> | </docs>

Powered by N-ATLAS for multilingual understanding across English, Yoruba, Hausa, Igbo and Nigerian Pidgin - while bank APIs remain authoritative for identity, authentication and money movement.

Working prototype → N-ATLAS-powered intelligence → Zenith sandbox integration

Why AccessFlow is more than another chatbot.

The moat is the system around the model: profile, orchestration, safety, lifecycle and bank integration.

01 Adaptive identity

A persistent profile for language + interaction preferences across channels.

02 Nigerian-language layer

English, Yoruba, Hausa, Igbo and Pidgin with code-switch-aware intent mapping.

03 Lifecycle personalization

Registration, KYC, authentication, payments, support - one adaptive layer.

04 Bank-grade safety

Structured intents, confidence gating, preview, explicit confirmation, auth and idempotency.

05 SDK integration

Bank keeps its systems; AccessFlow adds personalization without a core rewrite.

06 Measurable inclusion

Funnel and friction analytics convert accessibility into product decisions.

Positioning AccessFlow does for personalized banking experiences what payment gateways did for payments: one integration layer instead of rebuilding every journey customer-by-customer, language-by-language and channel-by-channel.

Value for customers and value for Zenith move together.

We will measure whether personalization improves independence, completion and trust - not just engagement clicks.

CUSTOMER OUTCOMES

- ✓ Complete registration independently
- ✓ Use preferred language and interaction mode
- ✓ Understand confirmations and errors
- ✓ Reach support without changing channels
- ✓ Retain preferences across future sessions

ZENITH / BANK OUTCOMES

- ✓ Lower onboarding abandonment
- ✓ Higher digital activation and repeat usage
- ✓ Fewer accessibility-driven support escalations
- ✓ Better customer trust and satisfaction
- ✓ Actionable friction analytics across journeys

Pilot metrics: onboarding completion • journey abandonment • accessibility-mode completion • intent accuracy • support escalation • zero unconfirmed transaction execution

A realistic path from hackathon prototype to bank pilot.

The architecture is intentionally adapter-based so bank integration replaces demo components without rewriting the experience layer.

Scale principle: replace the demo BankAdapter with Zenith APIs; the customer-facing AccessFlow contract stays stable.

A

TWO BUILDERS. ONE BANK-INTEGRATION PRODUCT.

Built to pilot, not just to pitch.

Kolade Atanseiyi

AI Engineer

N-ATLAS-powered multilingual AI · agentic orchestration · evaluation · accessible AI experiences

Obafemi Elijah

Backend Developer

Secure APIs · bank adapters · transaction orchestration · onboarding state machine · deployment integration
